Xhol I; Several hundred adult Schistosoma japonicum
(Anhui, P.R. China, strain), of mixed sex, were perfused
from the mesenteries of experimentally infected mice and
rabbits at the Queensland institute of Medical Research,
Brisbane, Australia (QIMR), and stored for several months
in liquid nitrogen. Subsequently, mRNA was isolated at the
QIMR from lysates of these worms by oligo dT
chromatography, using a kit from Pharmacia. The mRNA was
then shipped to Clontech, Palo Alto, CA, USA, who
constructed a cDNA library, First strand synthesis was
primed with an oligo-dT-XhoI-primer and synthesis was
primed with RNAse H and T4 DNA polymerase. The
double stranded cDNA was ligated to EcoRi linkers,
digested with EcoRi and XhoI, and ligated into the
phagemid vector lambda ZAP II XR. After construction of
this directional library by Clontech, it was returned to
the QIMR. During analysis of the library at the QIMR, we
have found that a small percentage, 2% to 3%, of the

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
